

Cyril Morlet

Senior Engineer — Secure Agent Runtimes · Zero Trust Infrastructure · ex-Bitfinex
fetch@sceat.xyz · +380 68 978 1786 · sceat.xyz · github.com/sceat · Fully Remote · UTC+8

SUMMARY

Engineer (12 years) building secure agent runtimes in production: multi-agent orchestration with planning, tool calling, and memory/state controls; authored MCP servers; Docker-in-Docker sandbox isolation for autonomous agents; and guardrail architectures — an immutable, CODEOWNERS-gated quality constitution plus filesystem locks (frozen-gates) that agents cannot bypass, holding even under prompt injection. Self-hosted zero trust production Kubernetes (Cilium, SOPS, Cloudflare Tunnels), operated solo. Ex-Bitfinex: security-critical exchange pipelines where bugs lose customer funds. TypeScript/Node primary; structured outputs and safety controls against Claude and GPT-family APIs daily; anticheat systems for a live game under adversarial load.

SKILLS

Agent Security: secure agent runtimes (planning, tool calling, memory/state controls), guardrail architectures, sandbox isolation (Docker-in-Docker), prompt injection resilience, MCP server authorship, structured outputs + safety controls (Claude, GPT/Codex)

Infrastructure Security: Kubernetes security (self-hosted production), zero trust ingress, Cilium network policy, SOPS secrets, least-privilege CI/CD, CodeQL, semgrep

Backend: TypeScript, Node.js, Java 25, Rust (working), GraphQL, REST APIs

Money-Path Security: Bitfinex exchange pipelines — deposits/withdrawals, reorgs, finality thresholds, fee accounting

Adversarial Systems: anticheat for a live MMORPG (1,300+ players), fail-closed gas sponsorship service

EXPERIENCE

Founder & Solo Engineer — Independent Products

Oct 2024 – Present · Remote

- Engineered guardrailed agent runtimes: multi-agent orchestration where every agent action passes mechanical gates (CodeQL, semgrep, immutable test anchors) — an architecture agents cannot self-modify (CODEOWNERS-locked constitution, frozen-gates filesystem locks), resilient to prompt injection.
- Built Noxant, agentic CI/CD: autonomous agents execute, verify, and publish inside Docker-in-Docker sandboxes on Kubernetes — least-privilege, fail-closed isolation.
- Authored MCP servers (tool calling + memory/state): sui-graphql-mcp, semantic-memory-mcp (Redis + embeddings), agent-pool — production Model Context Protocol implementations.
- Operate a zero trust self-hosted Kubernetes production cluster: Cilium network policy, SOPS-encrypted secrets, Cloudflare Tunnels ingress, GitOps — running a live game with anticheat under adversarial load.

Blockchain Integration Specialist — Bitfinex

Apr 2022 – Oct 2024 · Remote

- Owned end-to-end blockchain integrations for production deposit and withdrawal pipelines at a top-tier crypto exchange (Node.js, TypeScript).
- Integrated multiple L1/L2 chain backends into the exchange — including the Sui listing — and maintained them under production load.
- Owned chain-specific edge cases — reorgs, finality thresholds, fee accounting — where a bug loses customer funds.

Fullstack Developer — Affinidi

Jan 2021 – Apr 2022 · Kyiv, Ukraine (remote)

- Shipped React + Node.js microservices for self-sovereign identity and credential verification — REST APIs, Docker, AWS.
- Delivered across distributed teams spanning EU, Singapore, and India.

CTO & Co-founder — Sidy

Jan 2019 – Jan 2021 · Montpellier, France

- Led a 4-engineer team building a real-estate platform from zero to production; owned architecture, infrastructure, and hiring.

Software Engineer — Freelance & Open-Source

Jan 2015 – Jan 2021 · France (remote)

- Created and maintain 18+ open-source npm libraries (auth, real-time graphs, transport, storage) — github.com/HydrIO.

SELECTED PROJECTS

AresRPG — ~600K-line on-chain MMORPG shipped through the guardrailed agent harness · aresrpg.world

Noxant — agentic CI/CD — sandboxed autonomous agents on Kubernetes · noxant.io

MCP servers — sui-graphql-mcp · semantic-memory-mcp · agent-pool · github.com/sceat

EDUCATION & LANGUAGES

Self-taught engineer — shipping production code since 2014; open-source maintainer since 2015.
Languages: French (native), English (fluent)
